This portable utility was designed to be launched on USB flash drives. The program allows you to carry with you a CAD application that may be used for designing multi-purpose fixed-wing aircrafts. The program is very intuitive, and all you need is to install it to your portable media device and start working with it. You may analyze a mission profile, define the aircraft characteristics (i.e. wings, engine, and cargo), and, based on the information gathered by the program, draw a sketch with the aircraft displayed in the preview panel. With just one click on any of the elements shown in the panels, the program opens up the corresponding dialog. It takes just a few minutes to get the hang of the basics. The built-in propeller designer helps you define a new mission in terms of stall velocity, rate of climb, available power, take off distance, cruise speed, passenger weight, and selection between three blades or four blades. You may also preview the propeller design in a dedicated window. The initial sketch can be analyzed in a preview panel where you may alter the position of the pilot, engine, wing and tail, zoom in or out, and automatically rotate the design to different angles. Since the utility runs on portable media, the users can download it to their devices and store it for future use. You may then carry the executable file with you and launch it from any available drive. Define missions, wings, and sketches DACPEI helps you define a new mission in terms of stall velocity, rate of climb, available power, take off distance, cruise speed, passenger weight, and selection between three blades or four blades. What's more, you can select between several airfoil types, work with a sizing graph, and choose between several layout types (e.g. rectangular, elliptical), and present the details of the aircraft in 3D using a slider which works like a reverse-engineer tool. You may save the designs to XML file format, and export them to FlightGear so you may test them there. The built-in propeller designer allows you to provide information about the engine power, desired thrust, flying speed, number of blades, and propeller width. You may also preview the propeller design in a dedicated window. Propeller adjustments, performance results, and exporting options The built-in propeller designer allows you to design a propeller for the engine you are using. The application helps you define a new mission

Simple Propellers and Engine Modeling and Design Simple Propellers and Engine Modeling and Design is a GPL open source software that provide a simple but powerful approach to designing propellers and engines that are used to power aircraft. The supported engines include piston engines, turboprops, hybrids, and ducted fans. It can also use sea-level atmospheric air data, but these measurements require the Propeller Modeler to be launched. You can design propeller blades with various blade shapes and twist angles, diameters, and airfoil sections. There are no constraints in weight or length. The program allows you to import blades from Blender. You can model the blade solid, create any airfoil section that you want, and add or remove any part. You can also load any image and use it as the solid of the blade and change its transparency using the transparency sliders. You can design and export aircraft using the SuperGlue 3D scene (and any other scene format you want) including animation and textures. You can also import designs created by other software. Aircraft engines can be designed using a 2D interface or 3D scene. You can design the engines with blocks that represent cylinder, gearbox, and other engine elements. The engine blocks allow you to change their properties such as fuel flow rate, RPM, efficiency, power, airfoil, thrust, etc. Once the engine is ready, you can export it and use it to drive the propellers. Existing propellers can be used for testing, but new propellers can be designed to match the engine specs. Simple Propellers and Engine Modeling and Design Specifications: - Compatible with GRUB/LILO bootloader. - GNU General Public License, version 3. - Design and export propeller blades and engines for aircraft using SuperGlue. - Environment-based airfoil - The design works with sea-level atmospheric air data. - Both 2D and 3D interfaces - Engine blocks based on cylinders, gearbox, blocks - Import and export 3D models in Blender and SuperGlue formats - Design propellers for any engine and aircraft configurations - High-quality aircraft animation and textures - Design propellers with custom airfoil, rotors, and pneumatic systems - Blade design using precision tools Did you ever have to design a propeller for an aircraft? The application helps you design all kinds of aircrafts. It supports portable operation, has a streamlined user interface, and can export its output data to the FlightGear flight simulator. DACPEI is a CAD software application specialized in designing fixed-wing aircrafts using a set of modules for analyzing mission profiles, aircraft performance, propulsion, layout design, and sketches with aircraft drawings. Portable running mode This is a portable utility which can be dropped on portable media devices like USB flash drives and carried it with you. There's no installation setup included in the process, so you may run it by simply opening the executable file. Your Windows registry doesn't get clogged up with extra entries, and you may uninstall the program using simple deletion actions. User interface Upon a first encounter with the program's GUI, you are faced with a zero-populated environment with configuration settings. A small floating window (which can be moved anywhere on the screen) includes 9 modules that help you define your aircraft designs. With just one click on a module, the application opens up a panel in the main window which includes the corresponding customization parameters. You may open multiple modules at the same time and arrange them in the GUI using the drag-and-drop support. Define missions, wings, and sketches DACPEI helps you define a new mission in terms of stall velocity, rate of climb, available power, take off distance, cruise speed, and passenger weight. What's more, you can select between several airfoil types, work with a sizing graph, and choose between several layout types (e.g. rectangular, elliptical). The initial sketch can be analyzed in a preview panel where you can alter the position of the pilot, engine, wing and tail, zoom in or out, and automatically rotate the design to different angles. Propeller adjustments, performance results, and exporting options The built-in propeller designer allows you to provide information about the engine power, desired thrust, flying speed, number of blades, and propeller width. You may also preview the propeller design in a dedicated window. DACPEI is able to compute the required power, rate of climb, and rate of descent based on a custom set of performance parameters which are related to engine (e.g. number of engines, power HP, blades), airplane (e.g. weight, altitude), wing (e.g. surface, efficiency
